

## 2.2.1 Towards new guidance to develop and implement coastal adaptation integrating climate science

PARALLEL SESSION:  
TRANSFORMATIONS IN  
APPROACHES, THEMES AND  
SYSTEMS

28 March 2023

11:00 – 12:30

**NAP**EXPO  
CHILE 2023

# Sara Venturini, GEO Secretariat

Sara Venturini is the Climate Coordinator at the Group on Earth Observations (GEO) Secretariat.

At GEO she promotes access and the use of Earth observation data and solutions to inform and accelerate climate action by member countries.

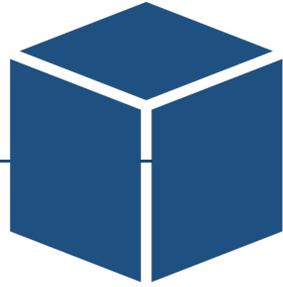

She has 15 years' professional experience collaborating with UN agencies and advising governments and organisations around the world on developing and implementing climate change policies, and participating in multilateral climate negotiations.

She holds a PhD in Climate Change Science and Management from Ca' Foscari University of Venice, Italy.

# **GEO: the single largest global partnership focused on Earth observations for impact**

# Evidence-based activities to support policy

## GLOBAL POLICY

Earth observations for climate action under the UNFCCC. Disaster risk reduction under Sendai Framework. Land degradation neutrality with UNCCD. Nature-based solutions with CBD. Mercury monitoring under Minamata Convention for Mercury.

## NATIONAL IMPLEMENTATION

Capacity development and projects. Agriculture monitoring for adaptation, flood early warning systems, impact of wildfires, coastal areas and ocean health, etc. Supplementary Technical Guidance to integrate Earth observations into National Adaptation Plans (NAPs).

# Agenda

## **Presentations (30 min):**

- **Joy Deep Chakrabartty, Knauss Fellow, NOAA / GEO Blue Planet**
- **Jorge Luis Vazquez-Aguirre, WMO**

## **Panel discussion and interaction with the audience (60 min):**

- **Andria Rosado, Data Manager, CZMAI Belize**
- **Jonathan Hodge, Programme Director, CSIRO Chile / GEO Blue Planet**
- **David Ongo Nyang'acha, RCMRD / Digital Earth Africa focal point**

# Survey

Join at

**slido.com**  
**#2742 174**

# Are you planning to use Earth Observation data for your NAP process?

Multiple Choice Poll 15 votes 15 participants

Yes, I'm planning to - 4 votes

I'm already using it - 7 votes

I don't know how to access EO data - 4 votes

No, I'm not planning to - 0 votes

# Are you planning to use Earth Observation data for your NAP process?

Multiple Choice Poll 15 votes 15 participants

Yes, I'm planning to - 4 votes

I'm already using it - 7 votes

I don't know how to access EO data - 4 votes

No, I'm not planning to - 0 votes

# Do you think a separate sectoral NAP for the coastal areas is necessary ?

Multiple Choice Poll  20 votes 20 participants

Yes, there should be a separate sectoral NAP for coastal areas - 4 votes

No, coastal areas should be included in the main country NAP - 7 votes

Not sure - 9 votes

# Joy Deep Chakraborty, GEO Blue Planet (NOAA/SOCD)

Joy Deep is a 2023 Knauss Fellow- working with GEO Blue Planet initiative within NOAA's Satellite Oceanography and Climatology Division (SOCD). He is a Ph.D. candidate in the Environmental Economics department at the University of Delaware. He also had a master's degree in Marine Policy and a bachelor's in Urban and Regional Planning. His works mainly focus on sustainable development, climate adaptation, natural resource valuation, behavioral modeling and environmental policy.

# Earth Observations in coastal adaptation

NOAA/NESDIS/STAR/SOCD

# Content

- **What is Earth Observation (EO)?**
- **How EO can help Ocean and Coastal monitoring?**
- **What kind of data EO can produce?**
- **How EO is used in different aspects of coastal adaptation?**

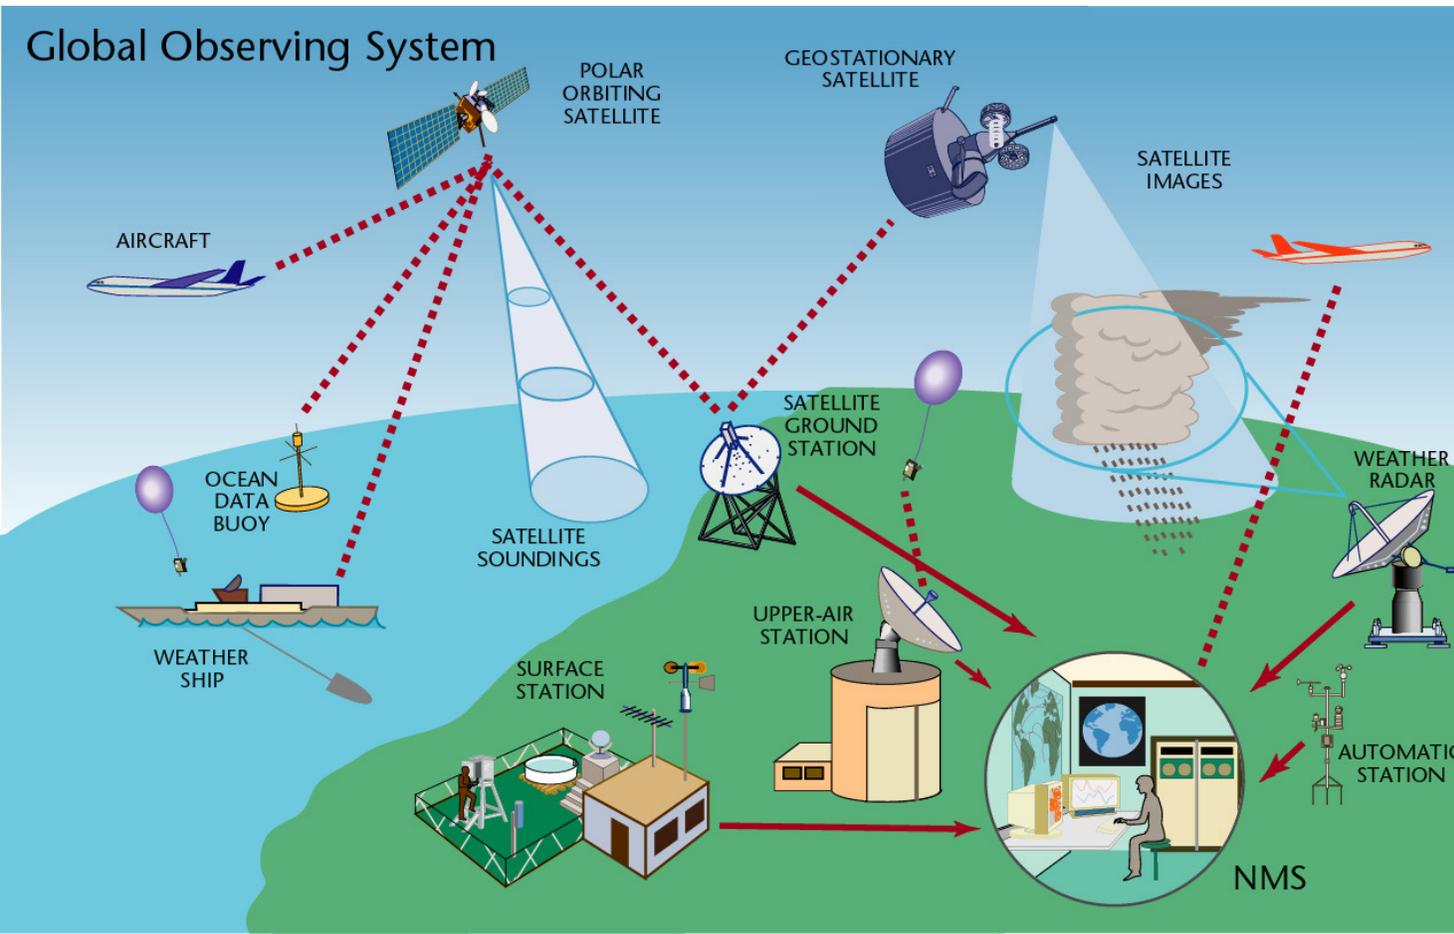

# What is Earth Observation System?

Earth observation is the gathering of information about planet Earth's physical, chemical and biological systems. It involves monitoring and assessing the status of, and changes in, the natural and man-made environment.

# What is Earth Observation System?

Earth observation is the gathering of information about planet Earth's physical, chemical and biological systems. It involves monitoring and assessing the status of, and changes in, the natural and man-made environment.

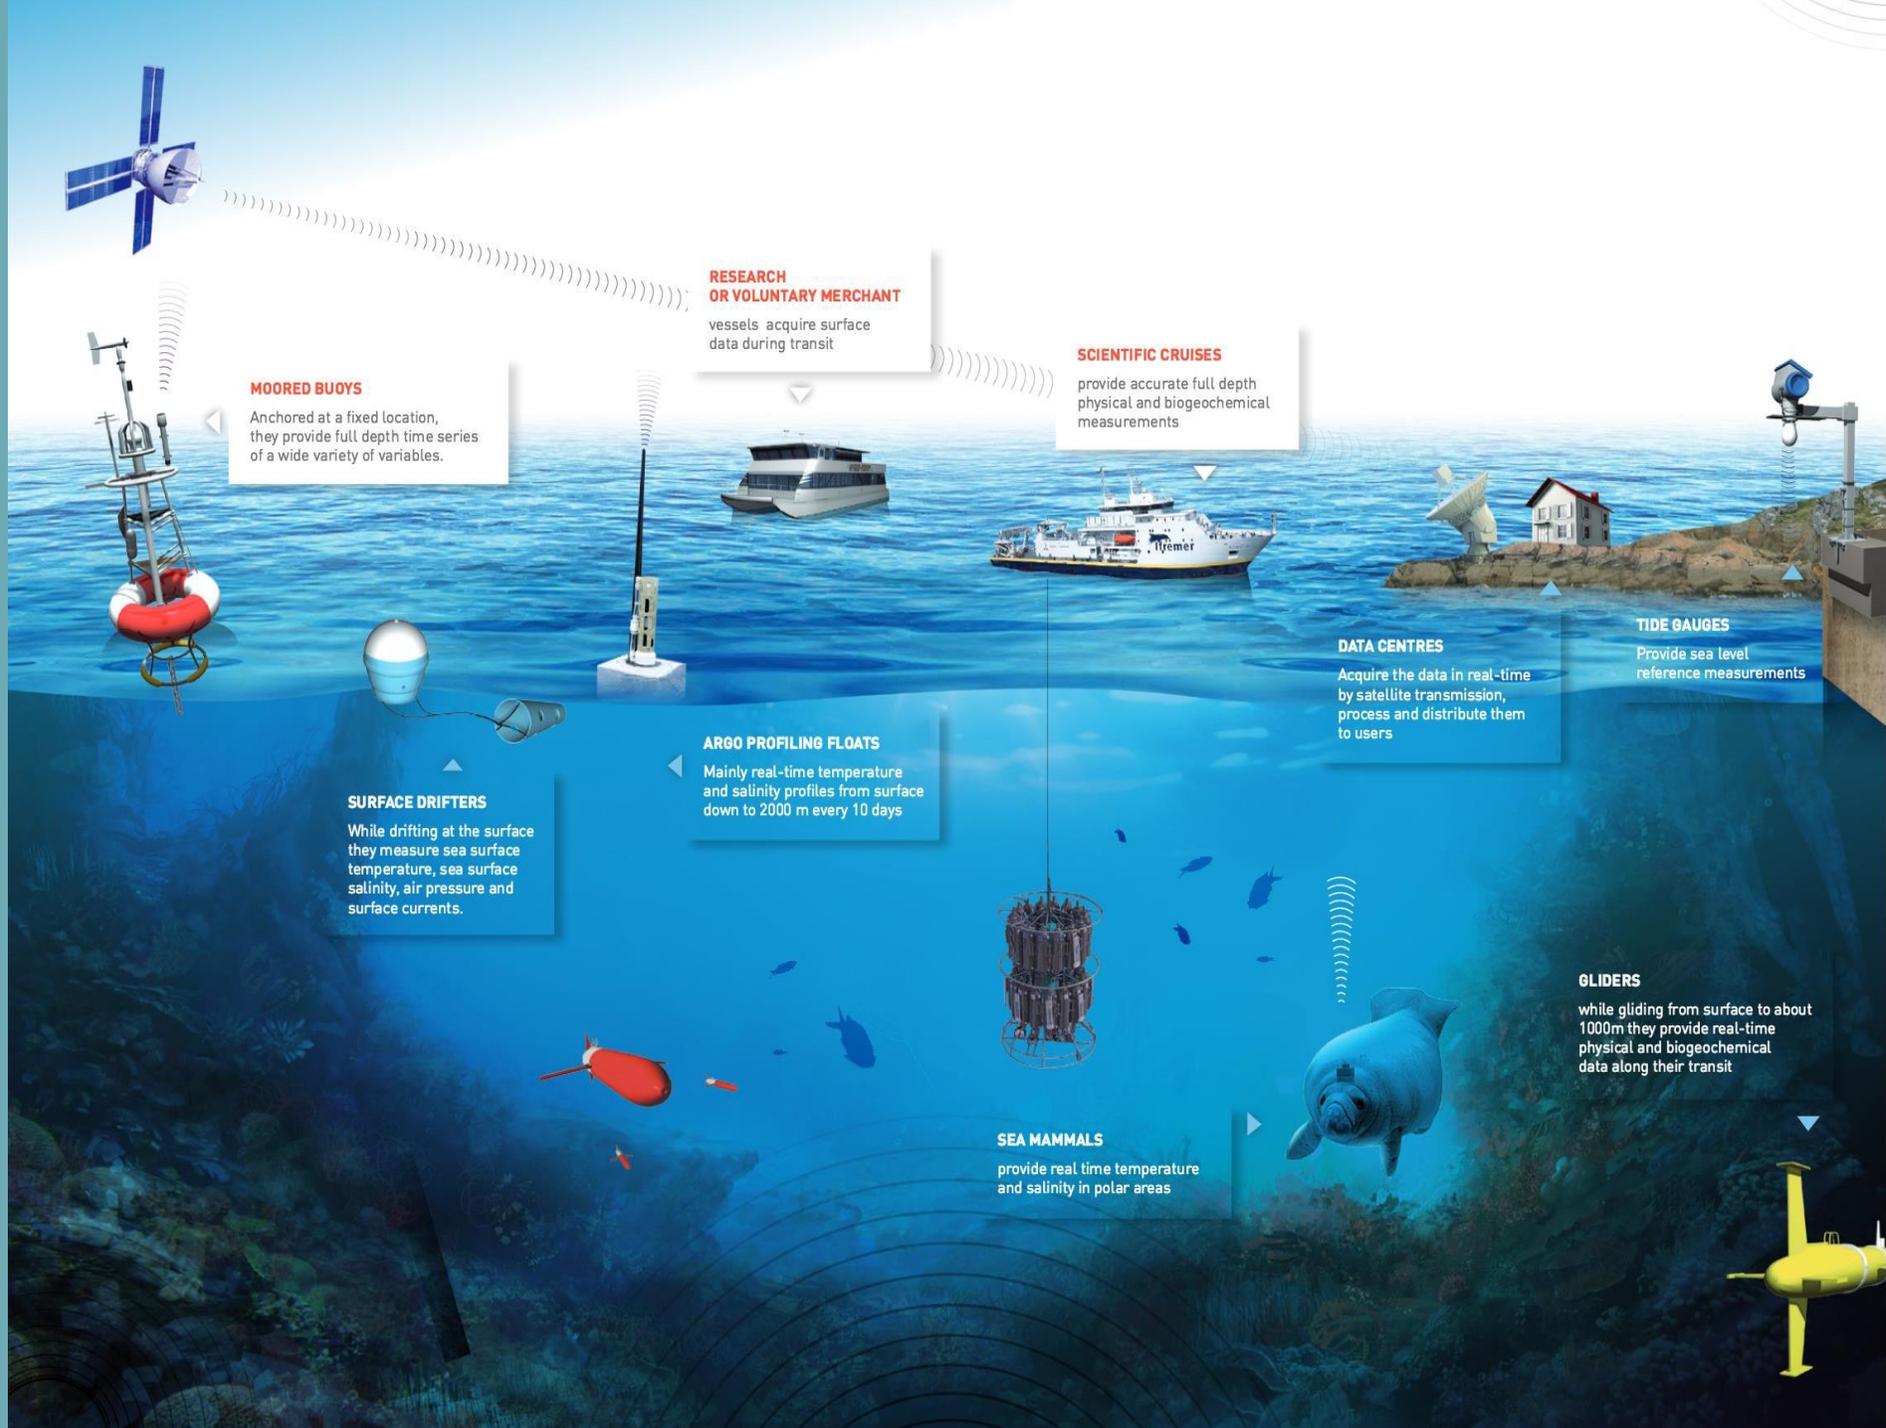

**Space Based observation**

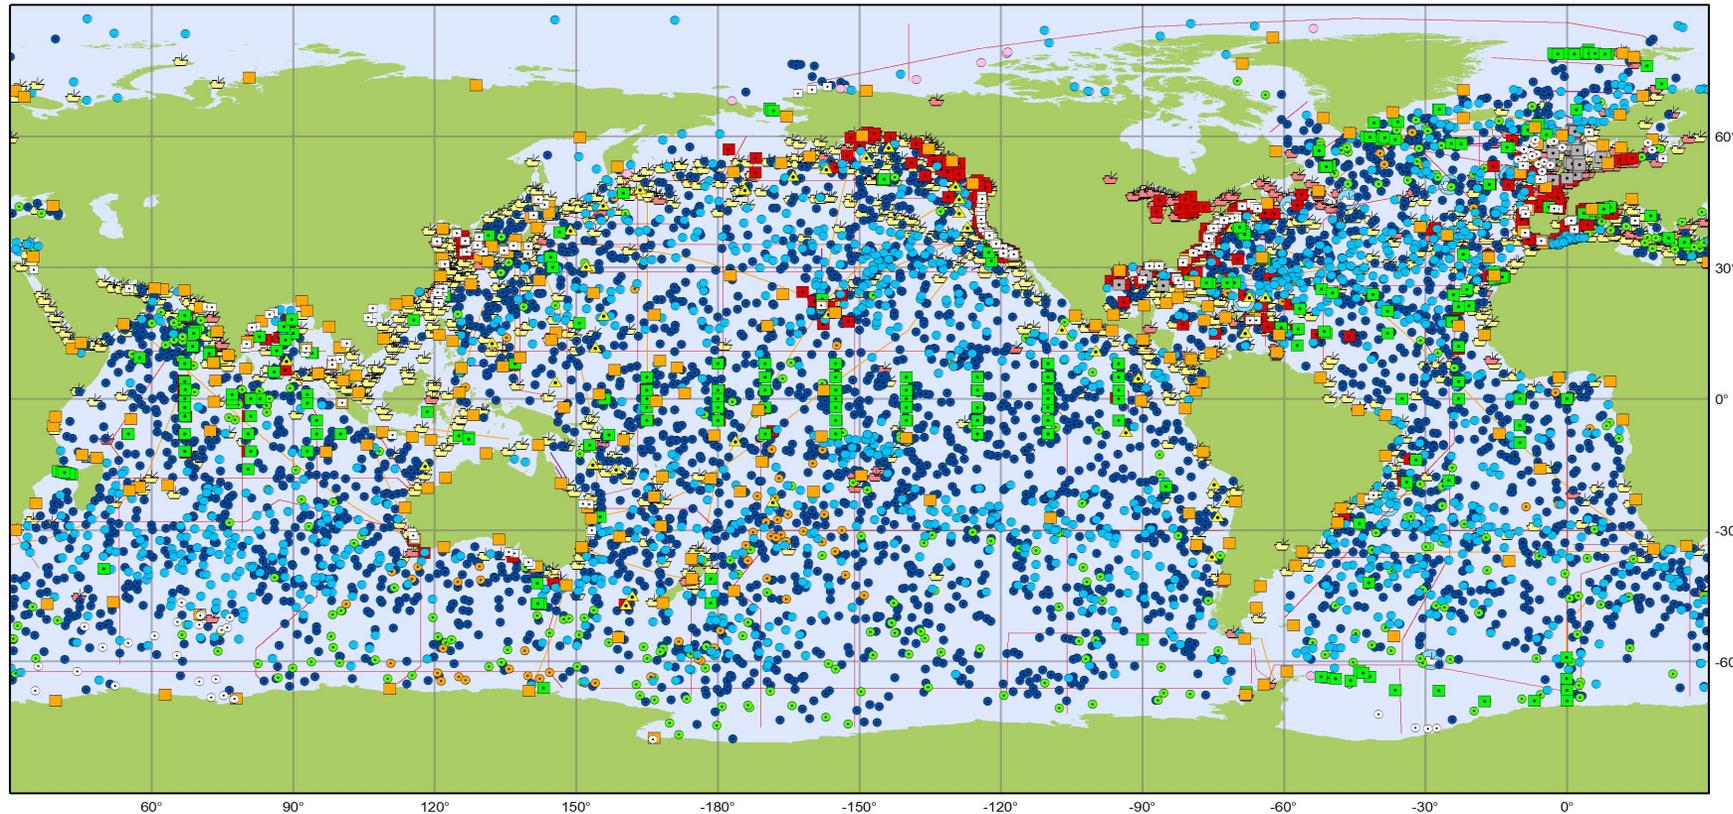

**In situ observation**

# Jorge Luis Vazquez Aguirre, WMO

Jorge Vazquez is a Deputy Project Officer (short-term) at the Climate Services Branch, Services Department of the World Meteorological Organization. His background is in atmospheric science (B.Sc., M.Sc.) and climatology. He has been collaborating with WMO for more than a decade as part of Expert Teams in Technical Commissions including ET on Climate Change Detection and Indices, Sector-specific Climate Indices and Climate Information for Decision-making.

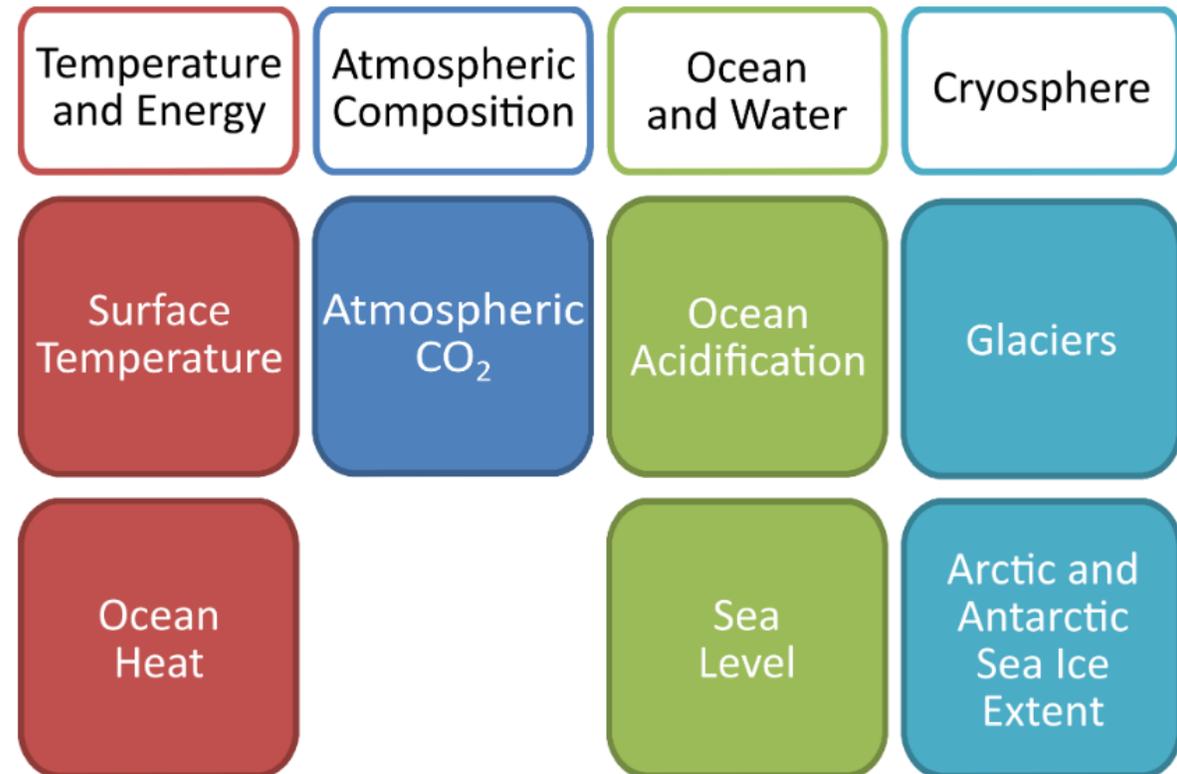

# **An introduction on the state of the climate indicators in relation to coastal vulnerability and hazards**

Jorge Luis Vazquez Aguirre

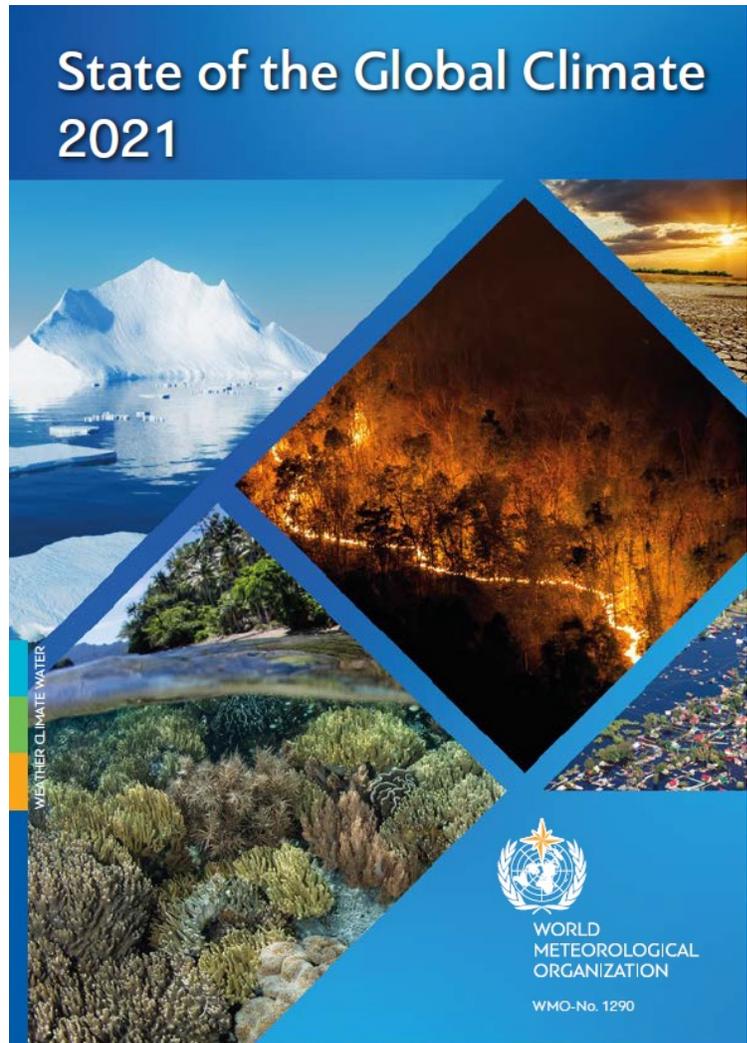

WMO

# Global Climate Indicators (climate change)

- Reference period or base state
- Periodical assessment
- Different frequencies
- Reported by the IPCC
- Operationally monitored
- Uncertainty in specific impacts
- Climate change drivers

# WMO State of the Global Climate

- On an annual basis, WMO publishes a report on the State of the Global Climate

- The report is comprehensive

- A provisional report is available early in the year

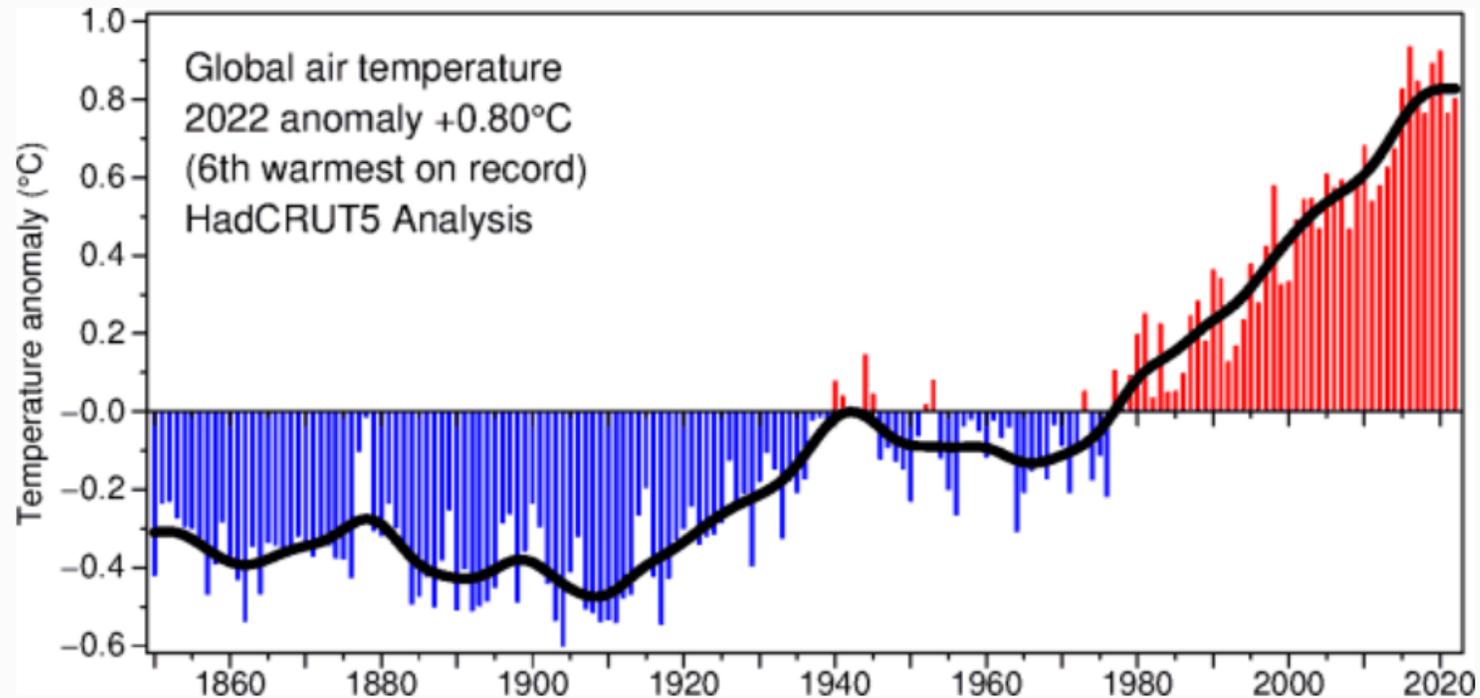

- <https://library.wmo.int>

# WMO State of the Global Climate in 2022 (provisional)

- Extreme heatwaves
- Drought
- Devastating flooding
- The rate of sea level rise has doubled since 1993
- Sea level has risen by nearly 10 mm since January 2020
- Sea level in the past 2.5 years account for 10% of the overall
- Glaciers in the European Alps had a record melting rate
- Mass loss in the Greenland ice sheet
- Ocean heat at record levels in 2021 (last assessment)
- Final release of the report on April 2023

# Global temperature

- Global air temperature 2022 anomaly was  $+0.80$  C (6<sup>th</sup> warmest on record) – Climatic Research Unit, UK

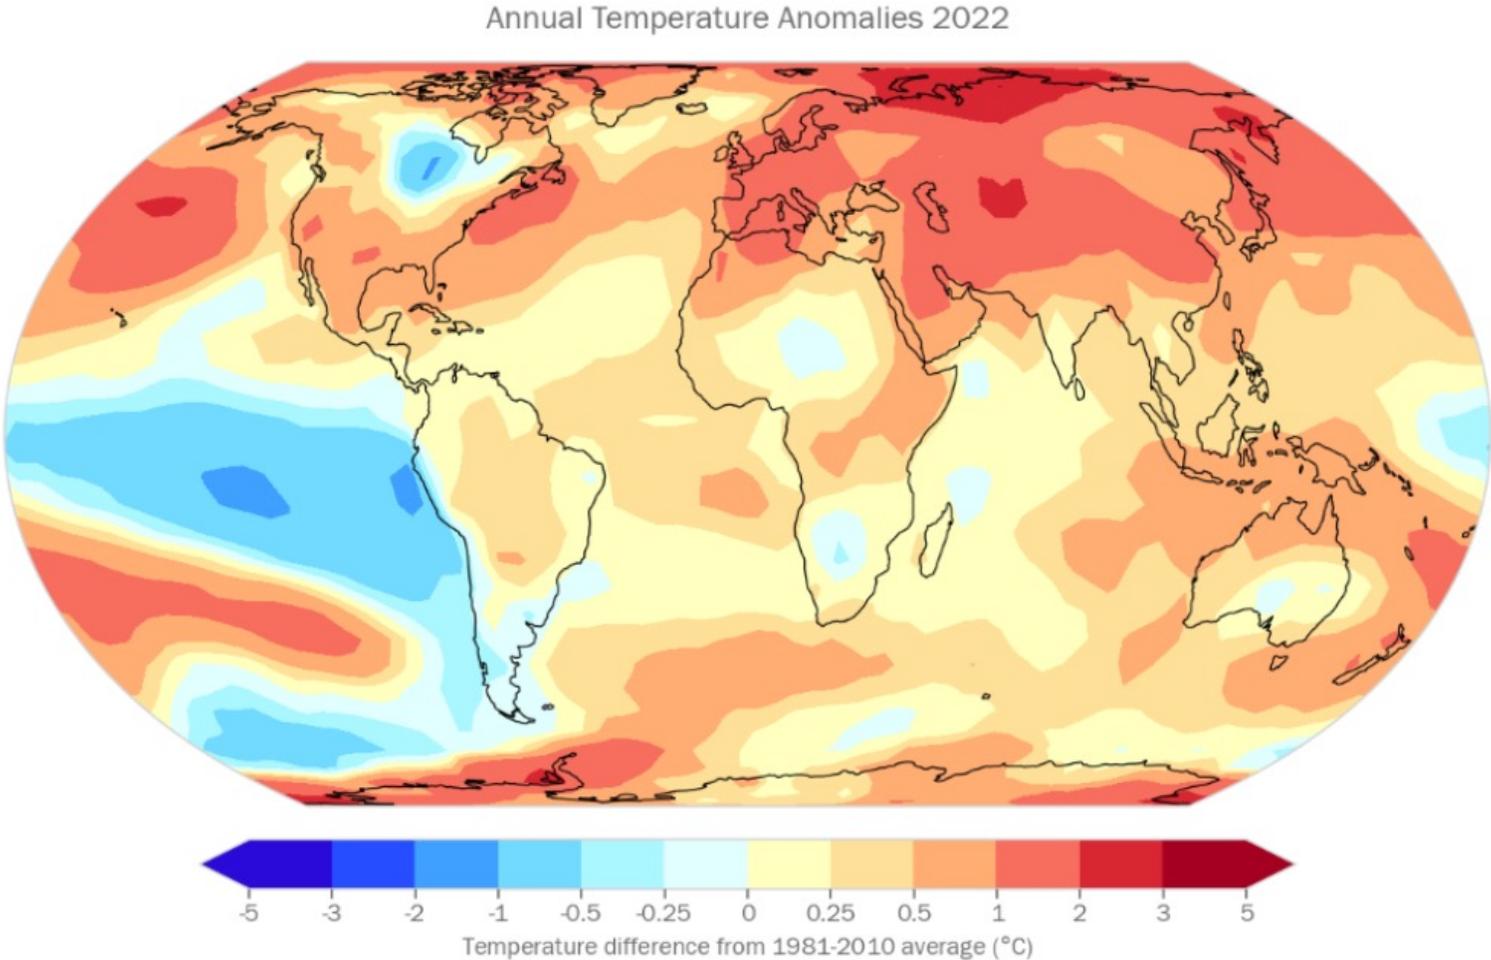

Global temperature record - updated February 2023

- Not the warmest probably related to presence of “La Niña”

# Annual Temperature Anomalies 2022

- Anomaly map (Jan to Sep, 2022)

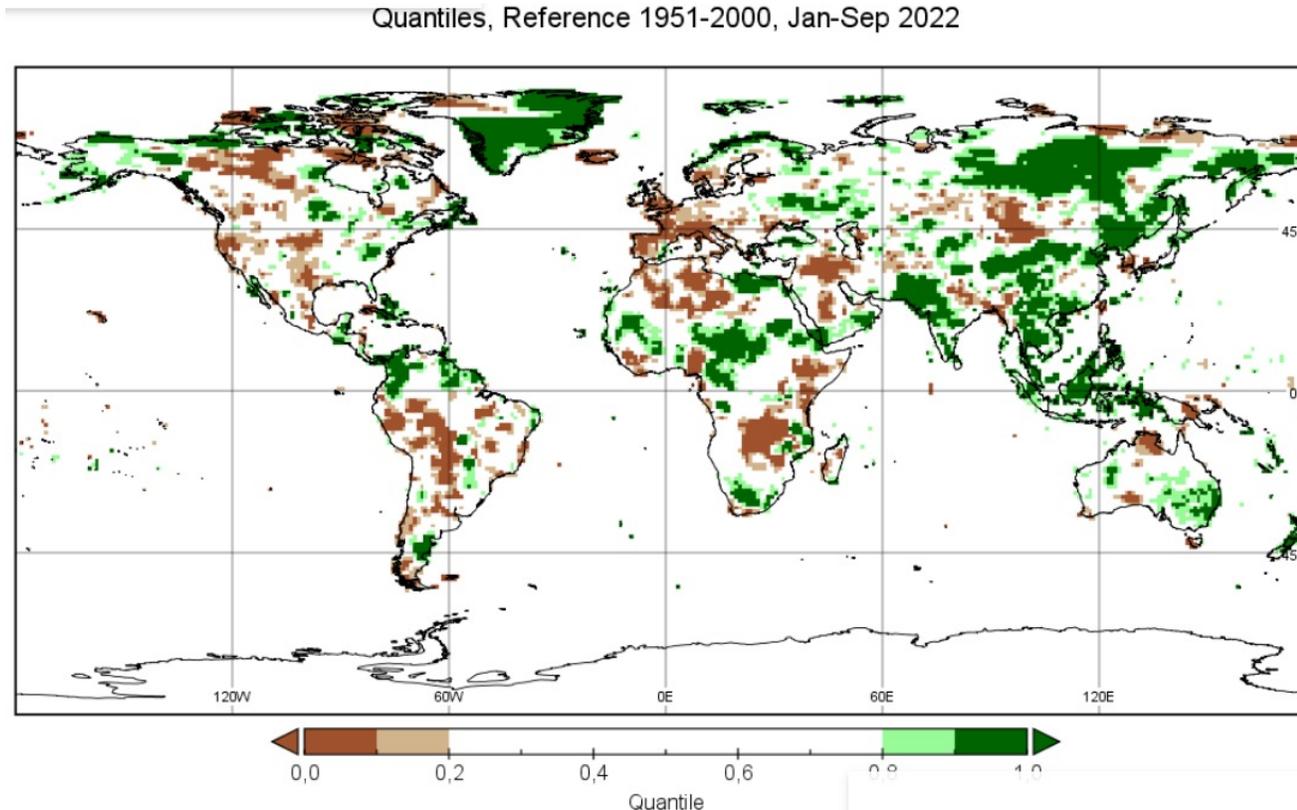

Berkeley Earth to 2022-09, ERA5 to 2022-09, GISTEMP to 2022-09, HadCRUT5 to 2022-09, JRA-55 to 2022-09, NOAA GlobalTemp to 2022-09

# Precipitation

## Precipitation Extremes

The majority of the Indian Subcontinent received high precipitation totals and the monsoon extended farther westward than usual towards Pakistan, where there was **extensive flooding**.

In 2022, large areas with **above normal precipitation** included large parts of Asia, the Maritime Continent, Australia, New Zealand, areas of northern South America, the Caribbean, west Africa, Sudan, coastal areas extending from western Libya to Egypt, and the southern Arabian Peninsula.

Meanwhile, regions with **rainfall deficit** included Europe, Central Asia, Northern Australia, Eastern Africa, most of North Africa, central and southern South America, and central and western North America.

# Atmospheric composition

The annual increase of methane was 18 ppb from 2020 to 2021.

**This is the largest increase on record.** Its causes are still being investigated.

**Real-time data indicate that global greenhouse gas emissions continued to increase in 2022.**

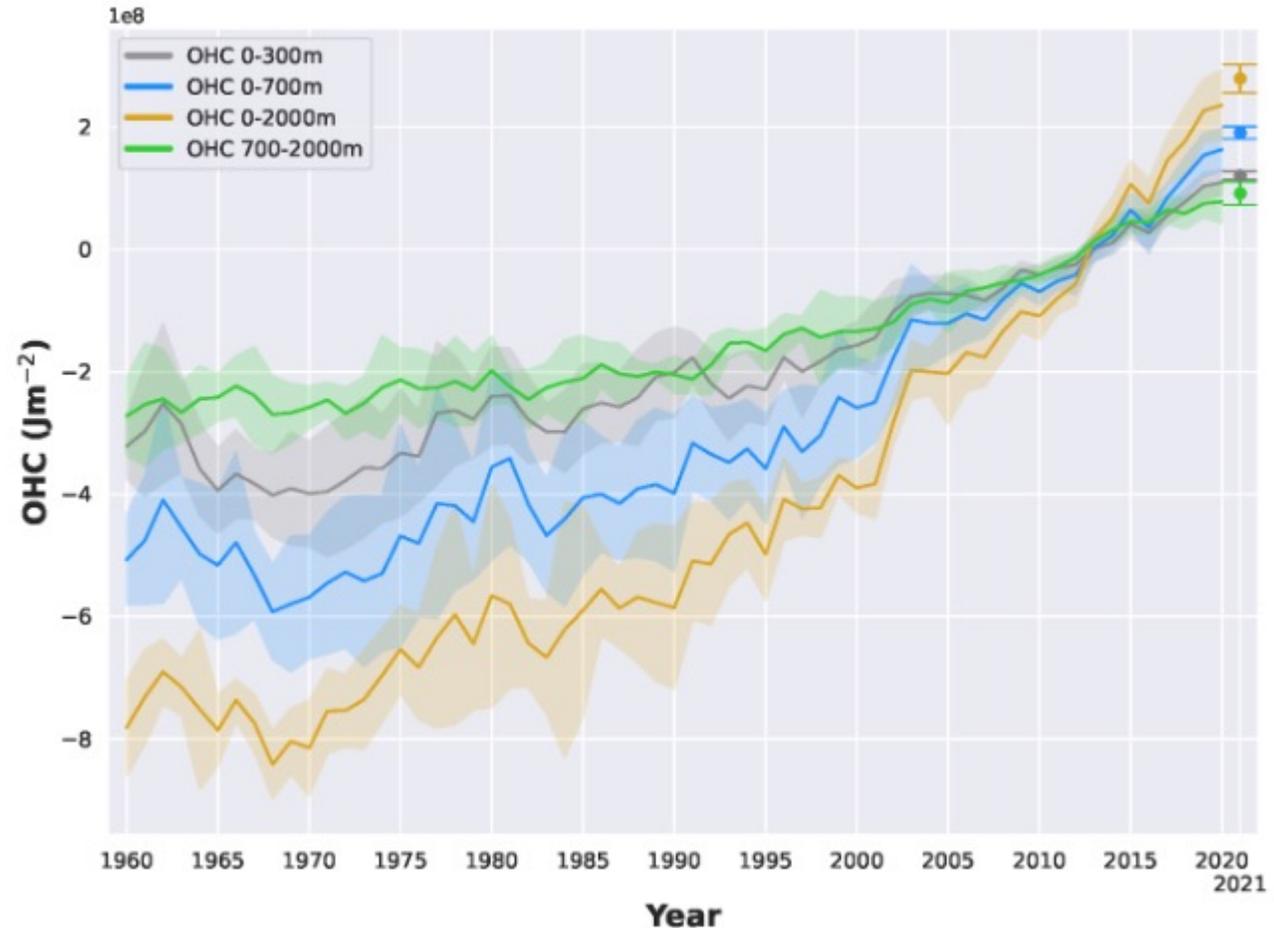

Carbon dioxide:  $415.7\text{ppm} \pm 0.2 = 149\%$  of pre-industrial levels.

Methane:  $1908 \pm 2 \text{ ppb} = 262\%$  of pre-industrial levels.

Nitrous oxide:  $334.5 \pm 0.1 \text{ ppb} = 124\%$  of pre-industrial levels.

# Ocean Heat Content

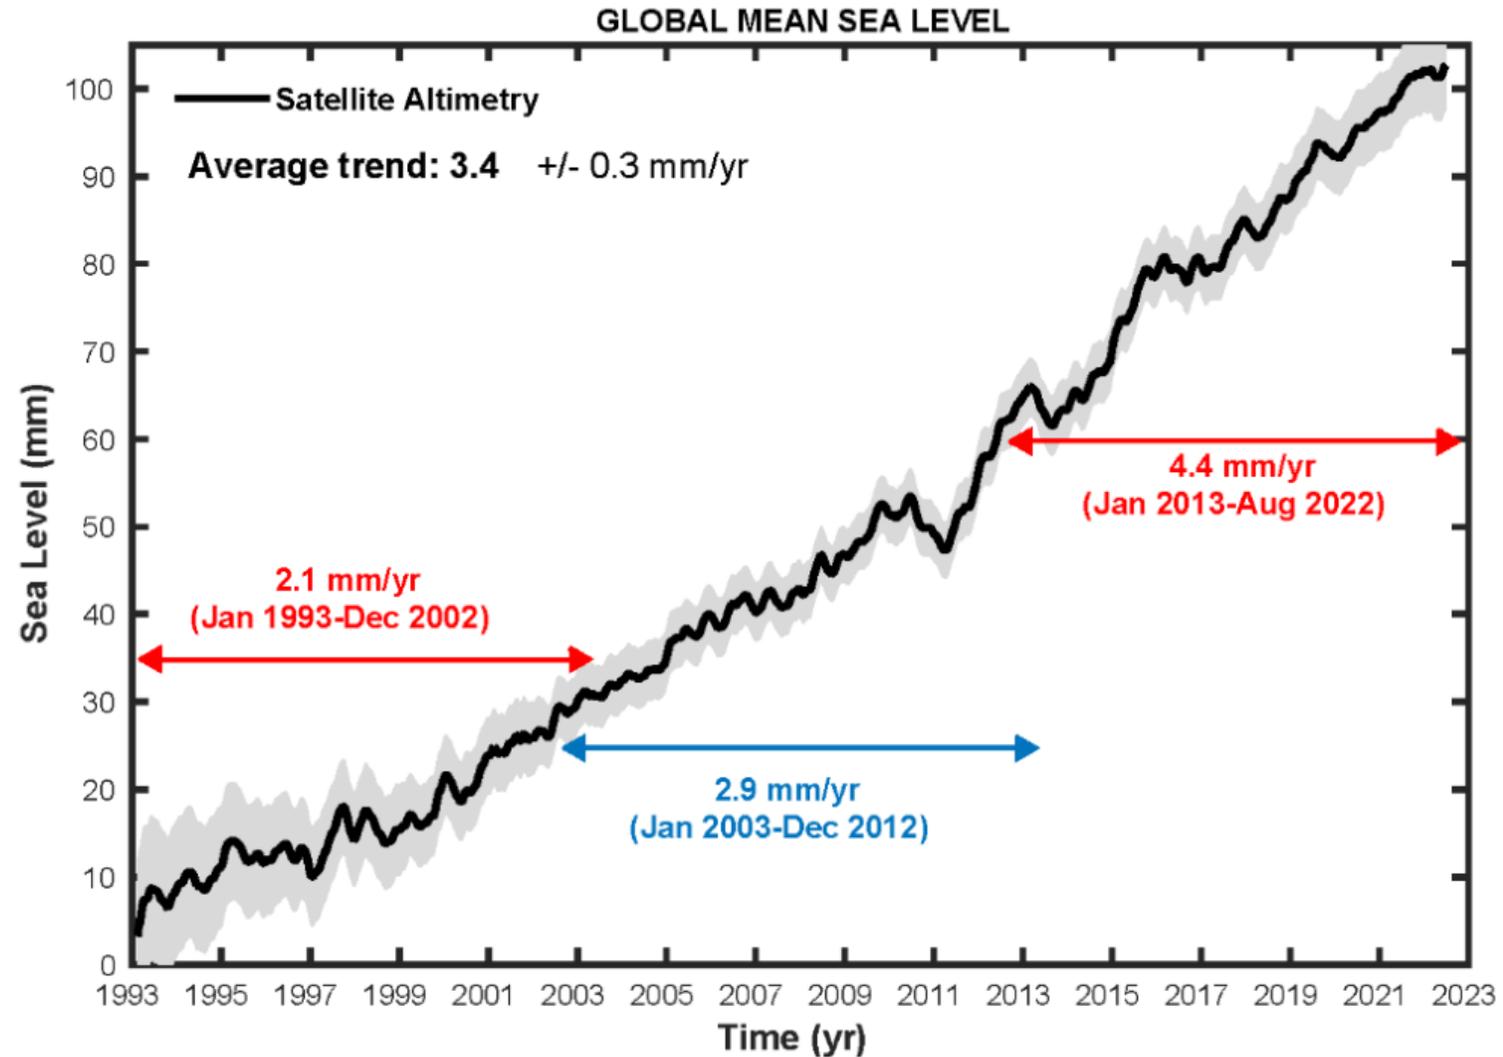

- As of 2021 (latest year evaluated) the Ocean has continued to warm

# Global Sea Level Rise

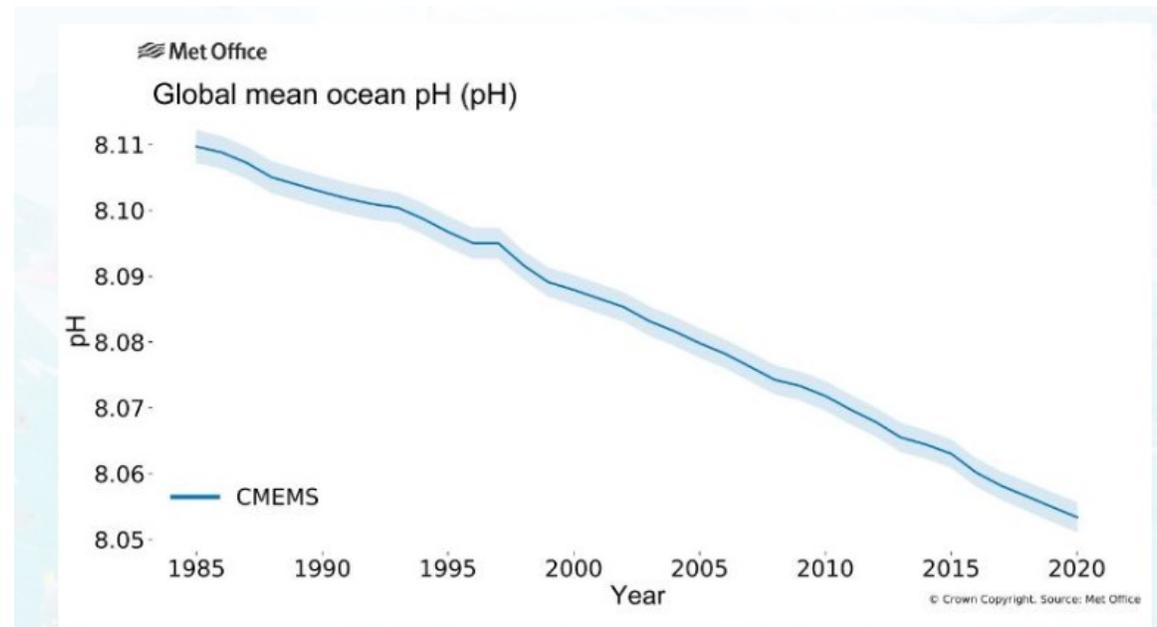

In 2022, global mean sea level (GMSL) continued to rise.

However, sea level does not rise equally everywhere: regional patterns of sea level change are dominated by local changes in ocean heat content and salinity.

# Ocean acidification

- Global mean ocean pH declining at rates not seen in the past 26000 years

*Global mean surface pH from E.U. Copernicus Marine Service Information (blue) covering the period 1985-2020. The shaded area indicates the estimated uncertainty in each estimate. Data from Copernicus Marine Environment Monitoring Service. Source: Met Office, United Kingdom.*

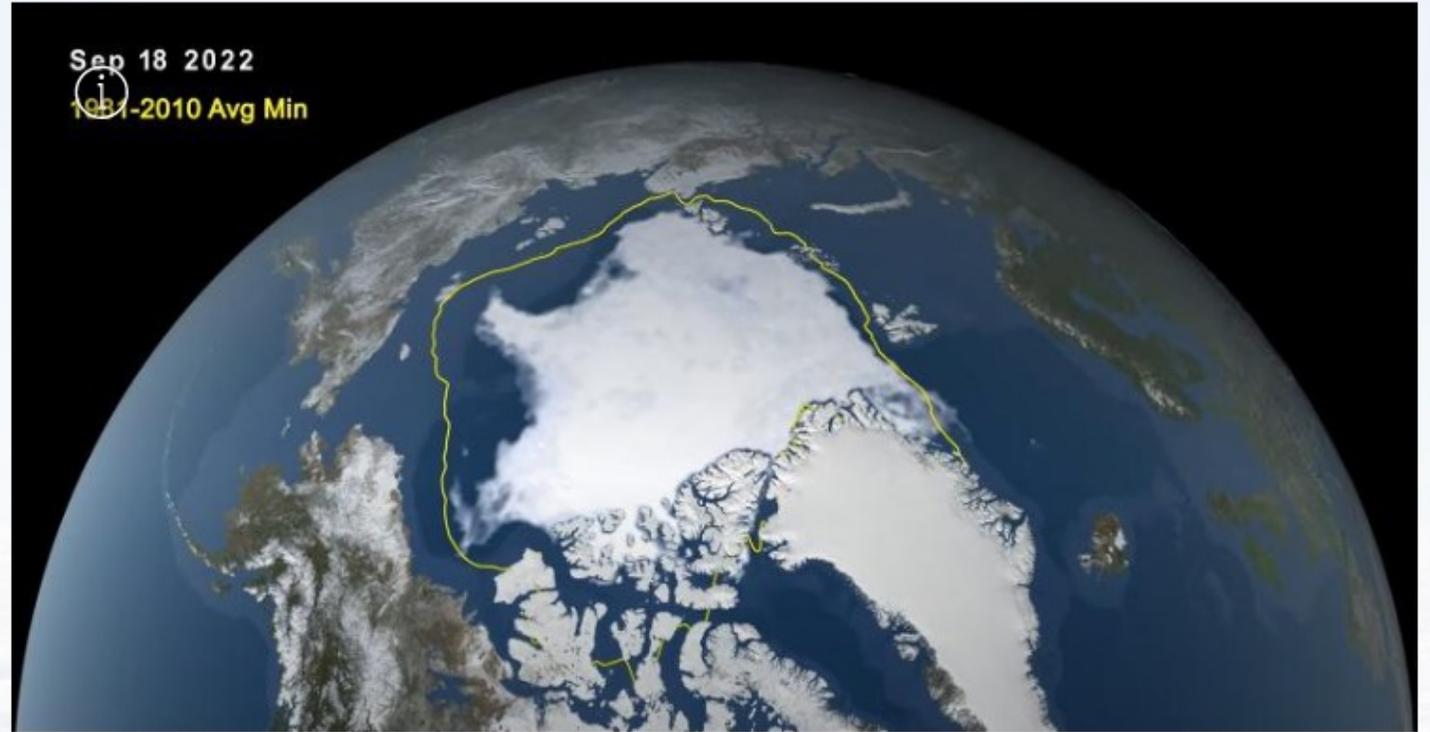

# Sea-Ice Extent

## Arctic Sea Ice

Arctic sea-ice extent was below the long-term average for most of the year. The September extent was **1.54 million km<sup>2</sup> below the long-term mean extent**, making it tied for the 11th lowest monthly minimum ice extent in the satellite record.

## Antarctic Sea Ice

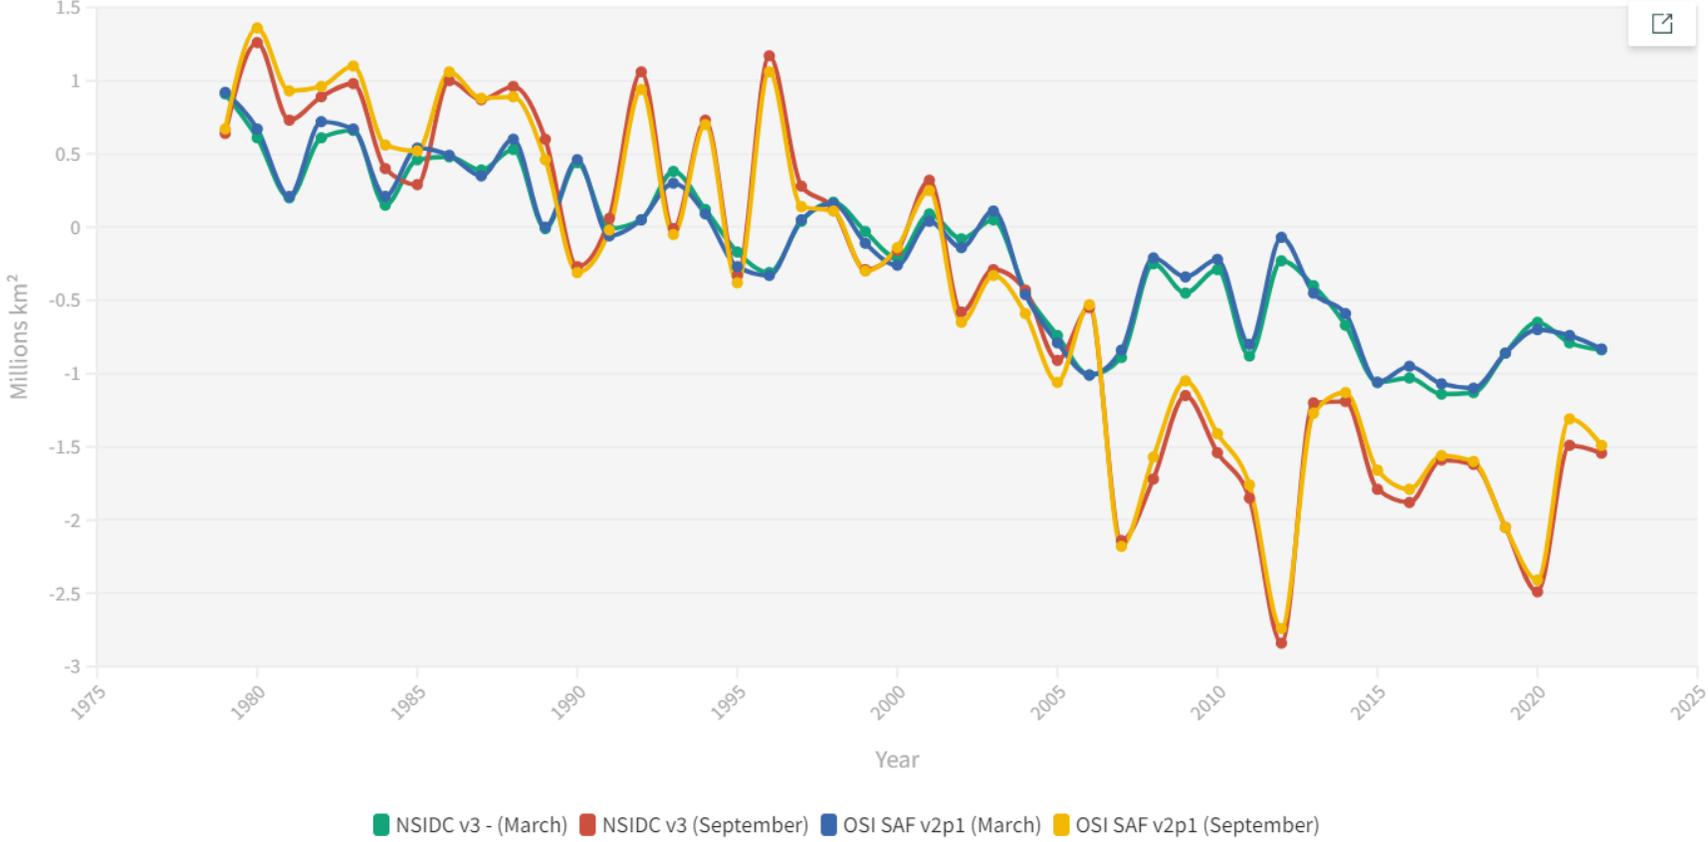

Antarctic sea-ice extent dropped to 1.92 million km<sup>2</sup> on February 25 2022, the **lowest level on record** and almost 1 million km<sup>2</sup> below the long-term (1981-2010) mean.

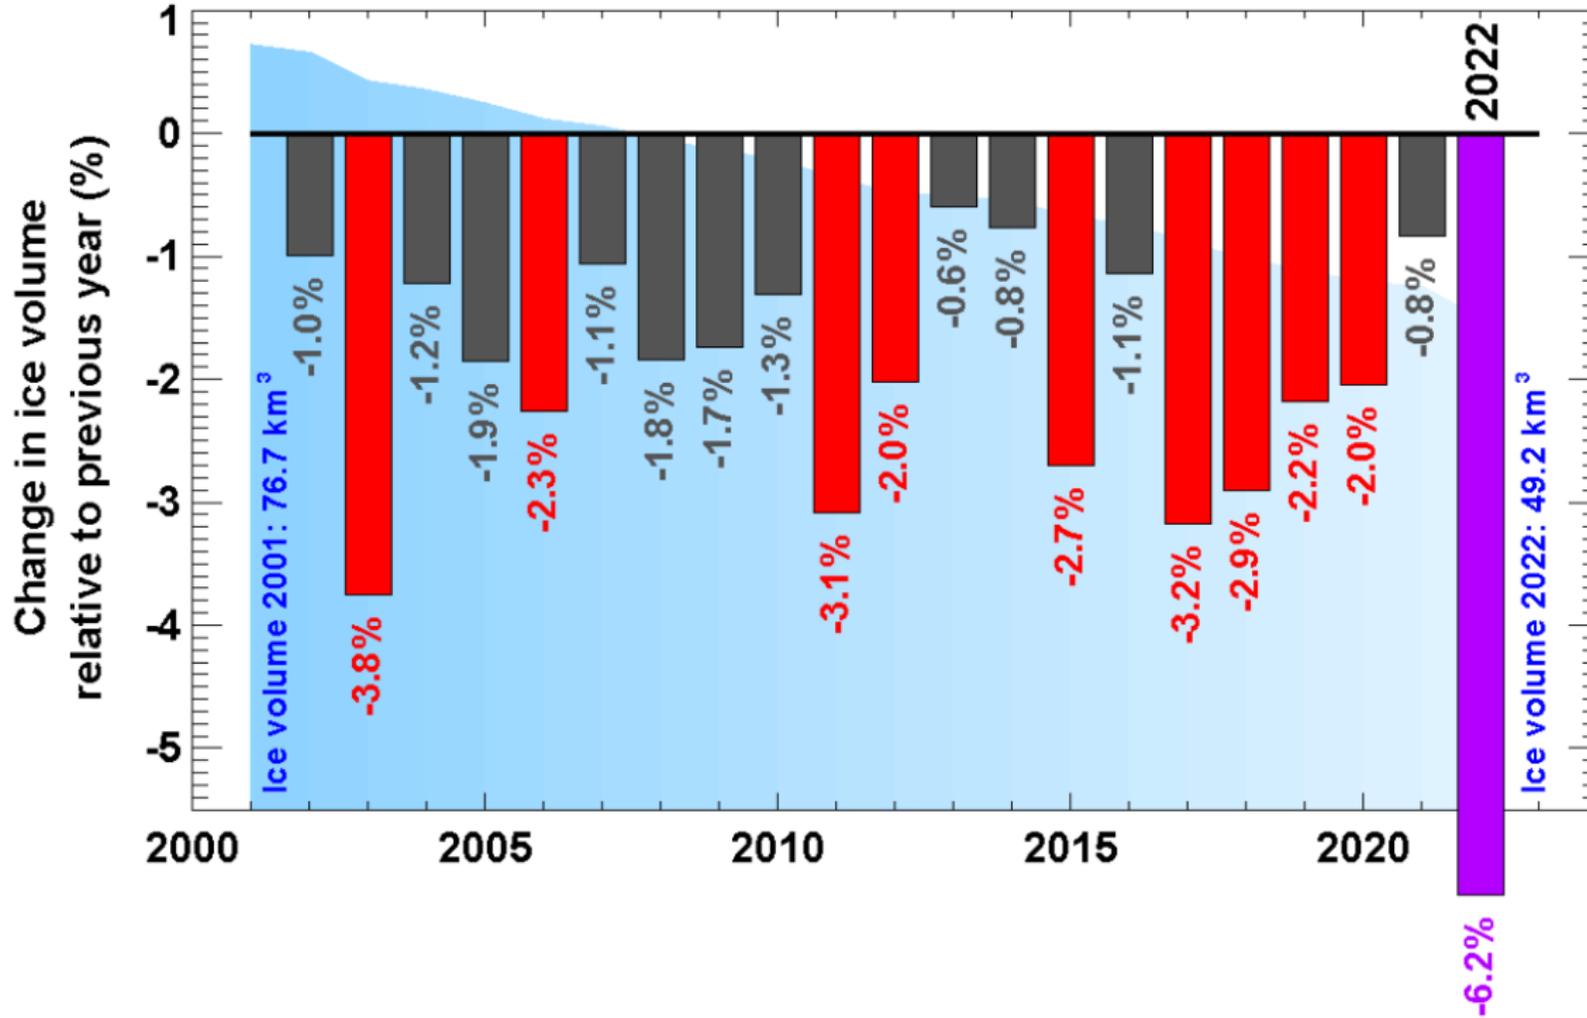

Minimum sea ice extent compared to the long-term average (1981-2010) in the Arctic on September 18, 2022.

# Arctic Sea-Ice Extent

- Difference from 1981-2010 average

# Glacier Mass Loss

## Exceptional Glacier Mass Loss in Swiss Alps

In the European Alps, records of glacier mass loss were shattered in 2022.

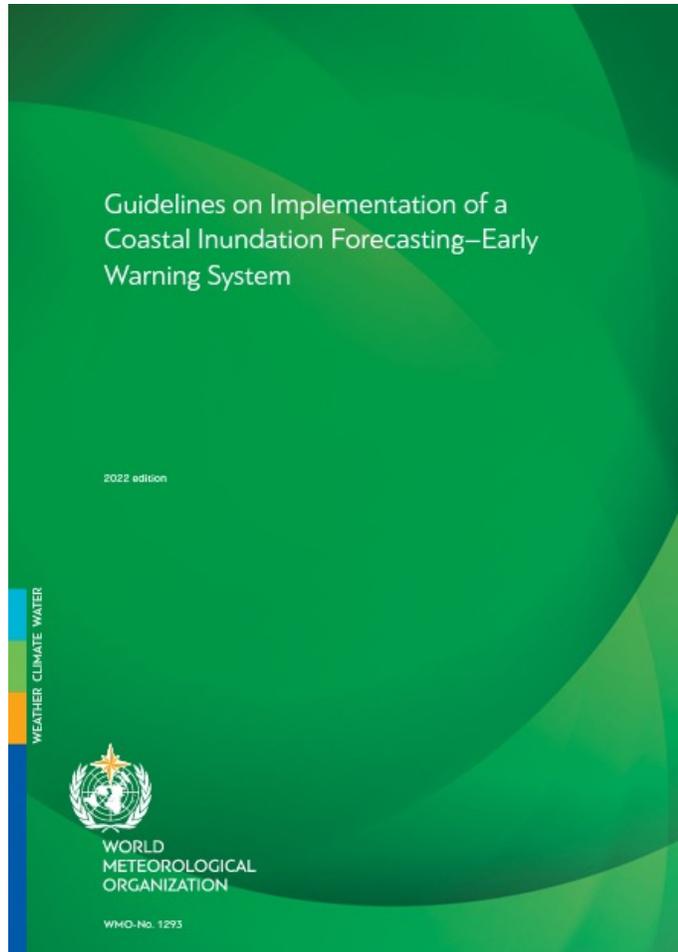

Mass losses were far beyond normal. In Switzerland **6% of the glacier ice volume was lost** between 2021 and 2022. There are three reasons for this extreme glacier melt.

1. Very little winter snow meant that the ice was unprotected in early summer.
2. Saharan dust blew over the Alps darkening the snow surface, making ice melt faster.
3. Long and persistent heat waves between May and early September 2022 led to massive ice loss.

# Final remarks

- Observations and monitoring of the climate system give us information on global indicators
- Changes in the State of the Global Climate imply in turn, changes in the mechanisms of energy balance
- Atmospheric and oceanic circulation in response to those changes result in anomalous weather and climate patterns
- Such anomalies are usually the origin of extreme events
- Extreme events in specific variables (wind, temperature, sea level, waves, precipitation) increase hazards for coastal areas

# Panel discussion

- 1) Why is there such a disconnect between the current NAPs and the extent of scientific literature and availability of case studies on coastal adaptation?
- 2) What argument do you make for the inclusion of coastal areas in your country's NAPs?
- 3) How do you elevate the importance of the coastal areas so that they become a significant feature of the NAPs or warrant a stand-alone sectoral NAP?
- 4) Moving beyond planning and taking action, can you provide examples of successful activities and solutions involving Earth observations and climate services for coastal adaptation?
- 5) What could be new and different in this supplementary NAP guidance that would change the paradigm towards scaled up adaptation in coastal areas?
